

VoiceBridge — Presentation Script & Delivery Guide

Google Developer Group Indore | Code for Communities 2.0 | Build with AI

FULL PRESENTATION SCRIPT (Target: 5-6 minutes) — Natural, Human Tone

1. Opening Hook (30 sec)

"Good [morning/afternoon] everyone. Let me tell you about **Rekha aunty** — she lives in a small locality where the streetlight outside her house has been broken for six months. She's complained to the local office three times. Nobody came.

Now imagine — she's not the only one. Hundreds of people like her are complaining about broken roads, water shortages, streetlights — every single day. The problem isn't that citizens stay quiet. **The problem is, nobody's listening to all of them together.**

Hi everyone, I'm Hariom, and with my teammates Krishika, Sakshi, and Avishi, we built something for exactly this gap. It's called **VoiceBridge — From Citizen Voice to Government Action.**"

2. Problem Statement (45 sec)

"So here's the real problem we're solving: **AI for Digital Public Infrastructure and Governance.**

Right now, if Rekha aunty wants to complain, she either has to fill a text-based form — which honestly, a lot of people aren't comfortable doing, especially if they don't type well or don't speak English — or she just gives up and talks to her neighbors instead.

So thousands of genuine problems just... disappear into the noise. And on the other side, the government doesn't get a clear, honest picture of what people actually need — so they end up planning infrastructure based on guesswork, not real data."

3. Our Solution (45 sec)

"Our idea is simple: **people already know what's wrong in their community — we just need to make it easy for them to say it, and easy for the government to hear it.**

So with VoiceBridge, doesn't need to type anything. Everyone can just opens the app, taps a button, and **speaks** — in own language, the way we would talk to our neighbor. Our AI takes

that voice, understands it, and turns it into clean, structured, location-tagged data that the government can actually act on — almost instantly."

4. Key Features (60 sec)

"Let me quickly walk you through how this works, step by step:

1. **multilingual voice input.** Speak, type, or message, in any language you're comfortable with.
 2. **intent extraction.** Our AI figures out what the problem is, how serious it is, and exactly where it's happening.
and this is one of my favorite parts
 3. **demand aggregation.** So if 200 people from the same street are complaining about the same broken road, instead of showing the government 200 separate complaints, we show them **one clear signal: 'this road needs urgent attention.'**
 4. **context enrichment,** where we combine this with existing infrastructure and population data.
 5. a **priority score** that's actually explainable, not a black box. And finally, a **decision dashboard** — basically a control room view for officials to see exactly what needs attention, and where."
-

5. Tech Stack — Google-Powered (30 sec)

"And all of this runs on Google technology.

Gemini is really the brain of the system : it handles the voice understanding and translation.

Google Cloud Platform powers everything in the backend.

Google Maps and Earth Engine help us visualize exactly where the problems are clustering. And

Firebase with Flutter gives citizens a smooth, simple mobile experience — because if the app feels complicated, people like Rekha aunty just won't use it."

6. How It Works — Process Flow (30 sec)

"So to put it all together in one flow: a citizen speaks into the app, Gemini understands and translates it, our system structures that into clean data, we detect hotspots where similar issues are clustering, we cross-reference that with real infrastructure data, and out comes one thing — a clear, prioritized recommendation for the government. **Voice in, action out.**"

7. Impact & Future Roadmap (45 sec)

"Now, why does this actually matter? Because it means people like Rekha aunty finally get heard — not as one complaint lost in a pile, but as part of a pattern the government can't ignore.

And this isn't just for one city. Because Gemini handles multiple languages, we can scale this across India, and honestly, even to other countries facing similar governance challenges.

Looking ahead, we want to close the loop completely — not just report the problem, but track it all the way to resolution, using automated work orders and real-time tracking."

8. Closing (20 sec)

"At the end of the day, VoiceBridge isn't just an app. It's a way of making sure that when someone like Rekha aunty speaks up, someone — actually, something intelligent — is finally listening, and turning her voice into real action.

Thank you so much. We'd love to take your questions."

HOW TO DELIVER IT (Speaking Guide)

1. **Pace:** Speak slightly slower than feels natural — nervousness speeds people up. Pause briefly after each section.
2. **Emphasis:** Stress the bolded phrases above out loud when practicing — they're your "punch" words.
3. **Eye contact:** Look at judges, not the screen. Glance at slides only briefly to stay oriented.
4. **Hands:** Use open, natural gestures when explaining flow (e.g., moving hand left-to-right for "process flow").
5. **Transitions:** Use bridge phrases between slides — "Now let me show you...", "Building on that...", "This brings us to..."
6. **Confidence phrase bank:**
 - "Let me walk you through..."
 - "What sets us apart is..."
 - "Here's where it gets interesting..."

- "To put this in perspective..."
- "The key takeaway here is..."

MOCK Q&A — Judge-Style Questions & Model Answers

Q1: How is this different from existing civic complaint apps (like CPGRAMS or city apps)?

"Honestly, most existing apps just collect complaints one by one — they don't connect the dots. Ours is voice-first, so it's usable by literally anyone, even someone who's never filled an online form in their life. And instead of just logging complaints, we actually group them together, so the government sees patterns, not just a pile of tickets."

Q2: How do you ensure data privacy for citizen voice data?

"Voice inputs are processed for intent extraction and then converted into structured, anonymized data points — we don't store raw personal identifiers with the complaint data used for aggregation and dashboards."

Q3: Is this technically feasible within a hackathon timeframe? What's built vs. planned?

Be honest here — state clearly which parts are working prototype vs. planned roadmap (e.g., "Our voice-to-intent pipeline and dashboard mockup are functional; the satellite tracking feature is part of our future roadmap.")

Q4: How does the priority recommendation avoid bias (e.g., favoring areas with more complaints over areas with more severe but fewer complaints)?

"Our severity scoring weighs both frequency and severity, not just complaint volume — the system is designed to flag high-severity, low-frequency issues too, not just the loudest areas."

Q5: How will you get government adoption / what's your go-to-market plan?

"We'd start with pilot partnerships with municipal corporations, similar to how other GovTech platforms have onboarded — starting hyperlocal, proving impact with data, and then scaling."

Q6: What was the hardest technical challenge you faced?

Be ready with a real, specific answer from your build (e.g., handling multilingual dialect variation in intent extraction, or geospatial clustering accuracy).

Next Steps With Me

1. Practice this script out loud 2-3 times — I'll give you a live mock round where I act as an audience/judge.
2. We'll time it and refine pacing.
3. We'll do a full mock Q&A session where I ask these (and tougher) questions on the spot.
